Program #1

Create a program in which allows the user to select one of the following four menu operations:

- **Enter a New Integer Value**
- **Print Pointer Address**
- **Print Integer Address**
- **Print integer Value**

For this program you need to create two variables:

- **one integer data type**
- **one pointer**

Using indirection, assign any new integer value that the user enters through an appropriate pointer

Have the program ask if the user would like to try again, and loop accordingly.

Submit the Code and a screen shot of the output to iLearn dropbox as a PDF.
